(57) Abstract :
The present invention relates to a Smart Pill Box system designed to assist users in managing and monitoring medicine intake. The system comprises a pill dispensing unit with seven individual slots (1), each equipped with a dedicated LED indicator (2), a mechanical door (3), and a limit switch (4) to detect access. An OLED display (5) is provided to show real-time clock information and scheduled medicine timings, while a push button allows manual deactivation of alarms (6). A microcontroller controls the operation of LEDs, limit switches, buzzer (7), and the display, and communicates with an external mobile control unit via Bluetooth. The external control unit enables users to input, update, and transmit medicine schedules, and also provides access to logs of recorded medicine consumption. At the scheduled time, the system alerts the user using visual and audio signals, detects medicine intake via door opening, and logs the event. This invention ensures timely medication adherence, improves user compliance, and provides a reliable interface for medicine schedule management.
